FC - Steam integration with xenforo 2
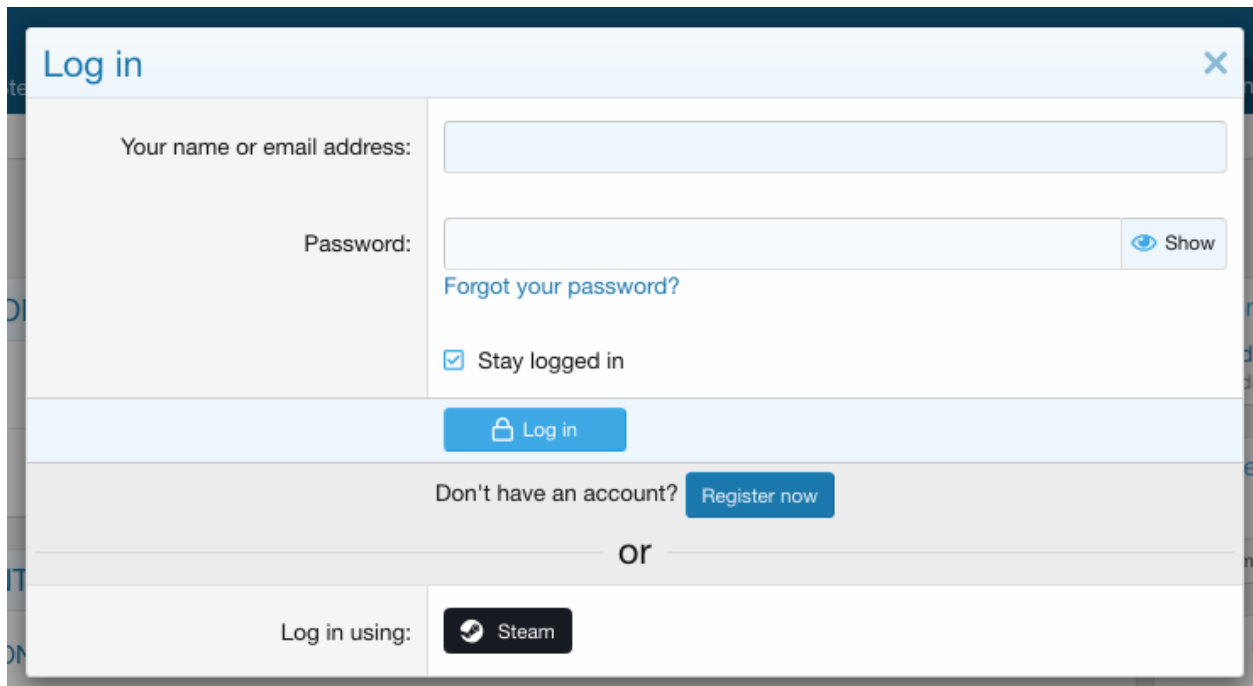

Instructions

Step 1:

Upload all files and folders from 'Xenforo' directory into your XenForo root directory.

Step 2:

Install this as a normal xf2 addon and check the data folder shoud have write permission recursively if not assign it and you are good to go.

Requirement Wise Instructions

1.Users will be able to login using their steam details.

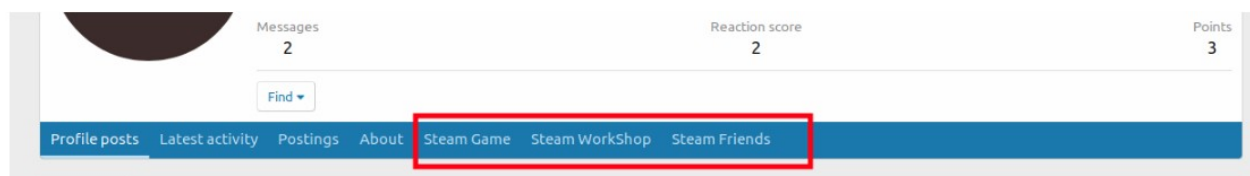

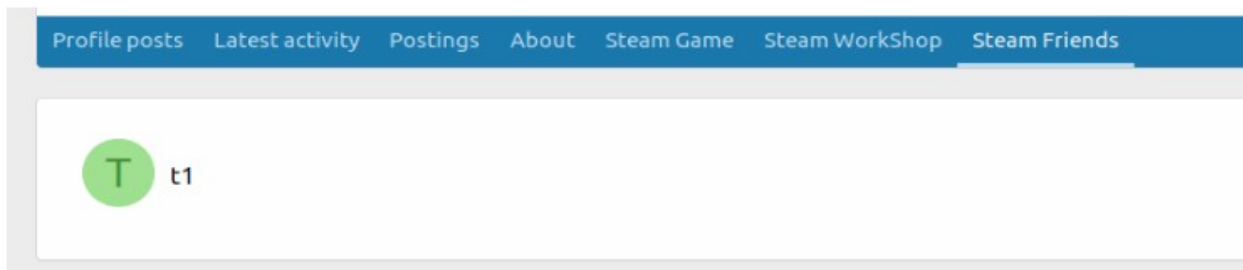

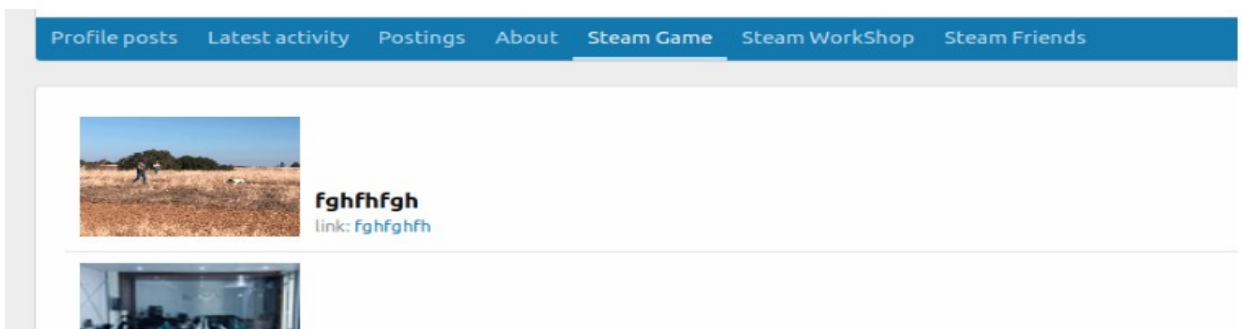

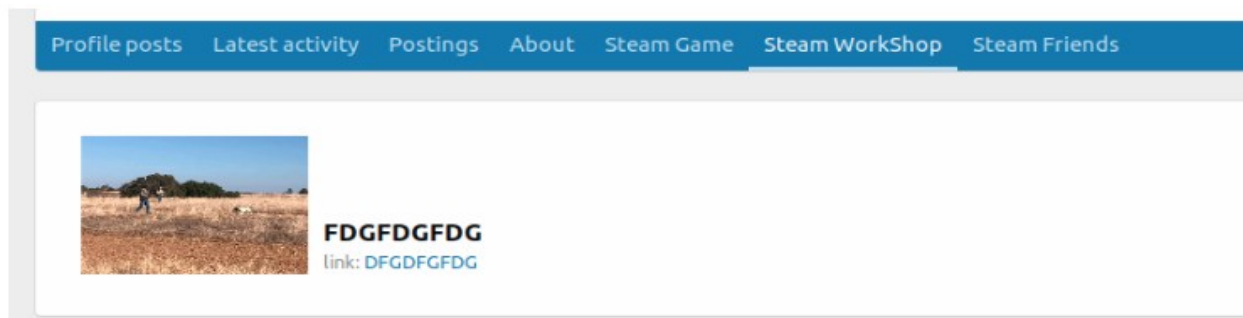

.

2. We will add three more tabs called (steam games, steam friends, steam workshop) in a users profiles.

These tabs are available at user profile page

3. Every tab will show data of its kind i.e steam games will show a list of games, steam friends will show a list of friends etc.

4. Games tab will have a button to add games, friends tab will have a button to add friends and steam workshops tab will have a button to add stream workshops

Suppose if users want to add games. What will be the flow and what information we need to receive against each entry whether he is trying to add new games or friends or steam workshops?
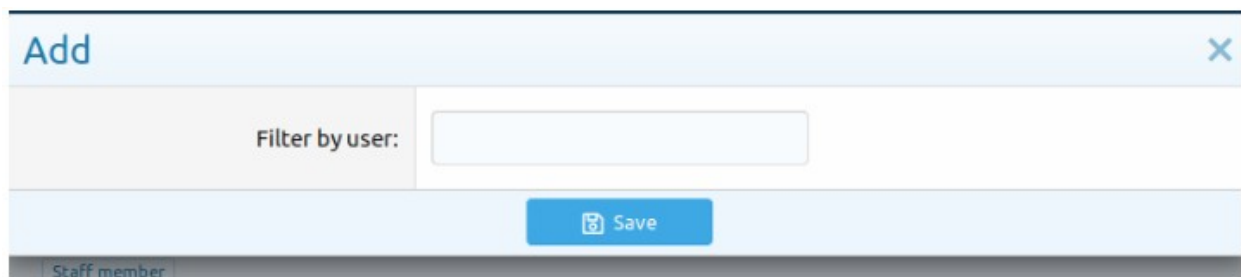

Steam Games: Game Name, Game Image, Game Link to the product website

Steam Workshop item: workshop item name, show workshop image, link to the workshop item
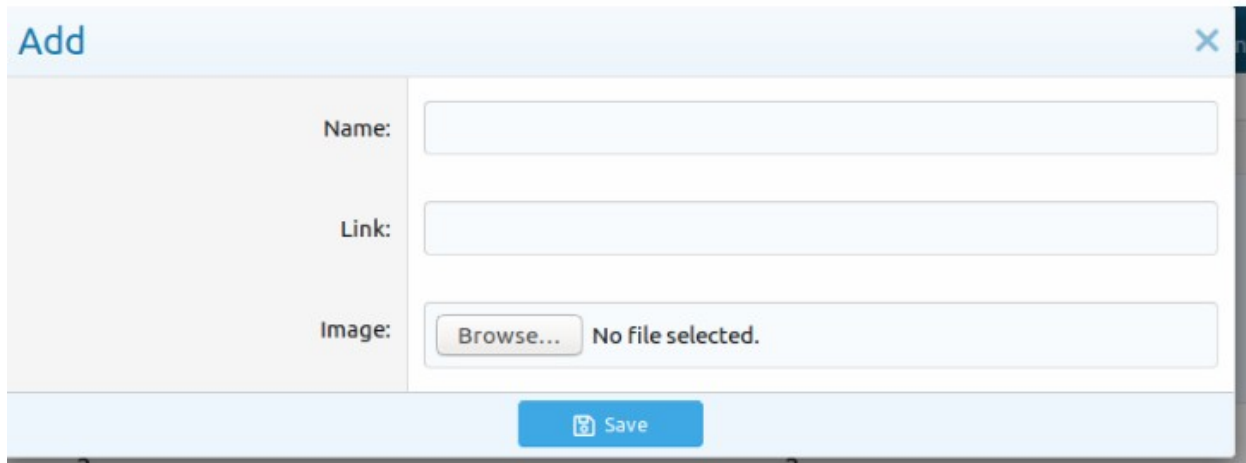

Steam Friends: Friends username.

Add Friends

User can add friends by typing username name of any xenforo member.

<u>Add Games/Workshop</u>

User can add games and workshop by providing name,link and image.

5. Users will be able to add games, friends, and workshops from xenforo 2.1 profile section. They can also sync automatically as long users have signed in with steam. After syncing system should fetch friends, workshops and games detail from stream and display on xenforo under respective tabs.

Syncing will work one way from stream to xenforo only.

This means, users are only able to sync friends, workshops and games from Steam. Suppose if User A has added 2 games from xenforo and now he wants to fetch more games from stream then he can do this.
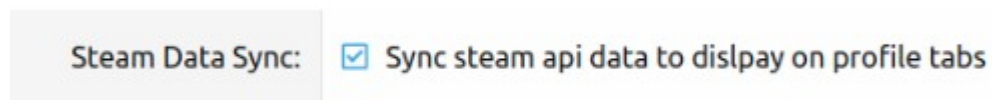

But

If user B has zero games on stream but he added 5 games from xenforo and now wants to sync it with stream, the System will not let him do this

One Way syncing functionality has been added as following

Click on user profile avatar on topbar and from dropdown click preferences

Now check the option in the screenshot below

when user check this steam api option then steam data will appear on user profile tabs.
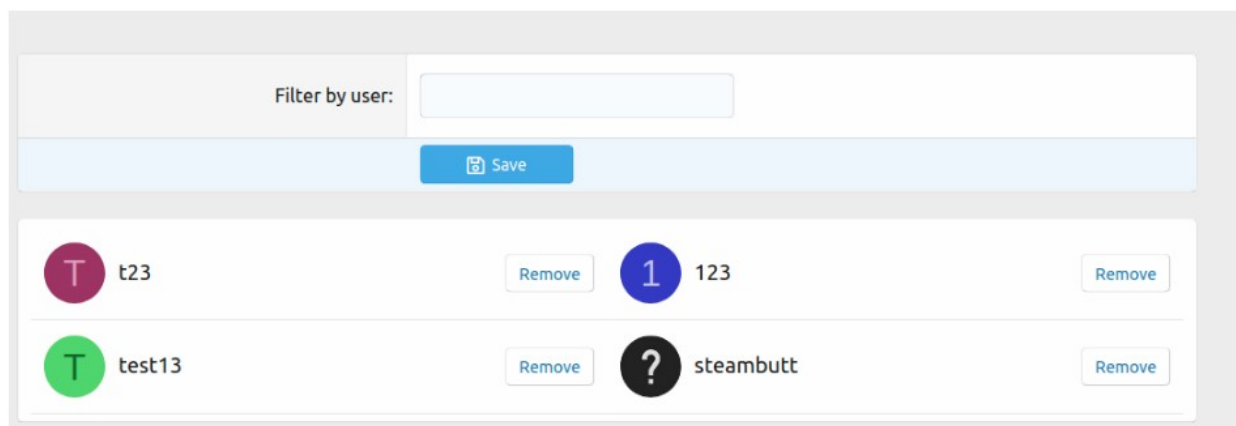

6- we need to provide every user with an ability to select which user or users can see his/her games, friends and workshops.

Click on user profile avatar on topbar and from dropdown click steam tabs privacy

Now type the name of the user you want to show data to and click save.

7.We would like to add an option in the admin control panel to sync games, friends and workshop items automatically. Suppose if admin click this option, the system should fetch all the user's data from the stream to xenforo.

Covered in requirement number 5.

8. User Group permission so admin can set which users group can see friends, games, and workshops on other users' profile pages.
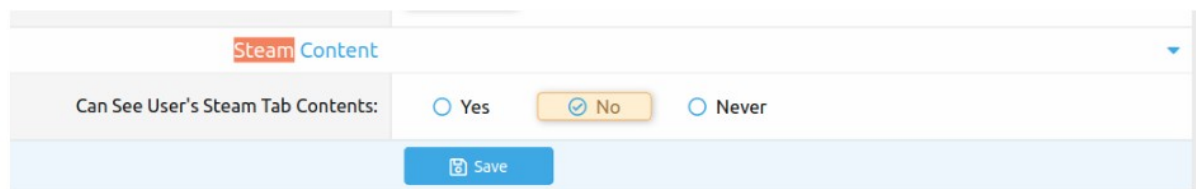

Goto admin panel

Click on group and permissions from left sidebar

Now click on user groups

Choose a user group and scroll down to bottom

You can find steam related permissions there

****************** THE END ******************
